

DBMS Project 3 - Submission Notes

This packet lists the deliverables included in the project folder and provides a place to paste the hosted Git repository URL before final submission.

Repository URL (paste after pushing to GitHub/GitLab): _____

Included Deliverables

- Source code for the Flask application
- Final 3NF SQL schema
- Normalization report
- README with installation, setup, and usage instructions
- AI_LOG.md disclosure file
- Local Git history with incremental commits and .gitignore

Quick Notes

- The application uses Flask, SQLAlchemy, SQLite, Bootstrap, and Jinja2.
- The database is created automatically on first run using final_schema.sql.
- The transaction demo occurs when a submission is recorded: a submission row is inserted, a log row is added, and enrollment progress is recalculated.
- The schema was updated to a cleaner 3NF design by moving repeated descriptive values into lookup tables.
